Configuration of temporary links for TimeShift

After standard installation and configuration *TimeShift* on the server, where channel are recorded, it is necessary to modify configuration file of NGINX on the storage - to add section at the beginning between *location* sections:

```nginx
    location /tslink/ {

        rewrite ^/tslink/(.+)/archive/(\d+)/(.+)
/stalker_portal/server/api/chk_tmp_timeshift_link.php?key=$1&file=$3 break;

        proxy_set_header Host 192.168.1.71; # <-- portal IP
        proxy_set_header X-Real-IP $remote_addr;
        proxy_pass http://192.168.1.71:88/; # <-- portal IP
    }

    location /archive/ {
        root /var/www; # <-- directory, where is archive folder (symlink
RECORDS_DIR."archive")
        internal;
    }

    # is necessary to exclude "tslink" and "archive" section from the access
to static files
    location ~*
^(?!(\/tslink|\/archive))\/.*\.(mpg|mpeg|avi|ts|mkv|mp4|mov|m2ts|flv|m4v|srt
|sub|ass)$ {

        secure_link $arg_st,$arg_e;
        secure_link_md5 "supersecret$uri$remote_addr$arg_e";

        if ($secure_link = "") {
            return 403;
        }

        if ($secure_link = "0") {
            return 410;
        }

        root /var/www/bb1;
    }
```

For access closing to folder /archive/ using port 88 (apache) it is necessary to put *.htaccess* file with next

```
Deny from All
```

After NGINX configuration it is necessary to add the row in server/custom.ini of the middleware server

```
enable_timeshift_tmp_link = true
```
