

IGMP PROXY

New Version 0.2.1: <https://github.com/pali/igmpproxy>

Old version 0.1.0:

```
wget http://downloads.sourceforge.net/project/igmpproxy/igmpproxy/0.1/igmpproxy-0.1.tar.gz
tar zxf igmpproxy-0.1.tar.gz
cd igmpproxy-0.1
```

Компиляция и установка:

```
./configure && make && make install
```

По умолчанию в Ubuntu igmproxy устанавливается в /usr/local/sbin/

Редактируем конфигурационный файл:

```
vi /usr/local/etc/igmpproxy.conf
```

Пример конфигурационного файла

```
##-----
## Enable Quickleave mode (Sends Leave instantly)
## Эту строчку раскомментируют только в том случае,
## если внутри всего лишь один клиент IP TV
##-----
#quickeave

##-----
## Configuration for eth0 (Upstream Interface)
## Здесь указаны параметры для публичного интерфейса,
## на который придет поток от провайдера
## и указаны сети, с которых возможно будут подключаться клиенты
##-----
phyint eth0 upstream ratelimit 0 threshold 1
altnet 10.0.0.0/8
altnet 172.20.20.0/24
altnet 192.168.0.0/24

##-----
## Configuration for eth1 (Downstream Interface)
## Типовая конфигурация для внутреннего интерфейса
## смотрящего в домашнюю сеть
##-----
```

```
phyint eth1 downstream ratelimit 0 threshold 1
```

Запуск вручную /usr/local/sbin/igmpproxy /usr/local/etc/igmpproxy.conf.
Автостарт - добавить igmpproxy /etc/igmpproxy.conf & в /etc/rc.local.

Более элегантный вариант запускать как демона через /etc/init.d/ (Рекомендуется!!!)

```
vi /etc/init.d/igmpproxy
```

Приводим к виду:

```
#!/bin/sh
### BEGIN INIT INFO

:
```

Устанавливаем права и запуск

```
chown root:root /etc/init.d/igmpproxy # Меняем владельца  
chmod 755 /etc/init.d/igmpproxy # Меняем права и делаем исполняемым  
update-rc.d igmpproxy defaults # Добавляем в загрузку  
  
/etc/init.d/igmpproxy start # Старт/Рестарт/Стоп
```
